The Age of Aquarius has to find us in it without the protolithic racism and hatred of the jews against all Gentiles being everywhere in this world. Age of Aquarius with jewish genocidal maniacs at the helm of this world, will be a disaster. Not for them, but for everyone else involved. RTR's can solve this and pave the way for this to not happen.

There is no going back from this revolution of technology, but the terms in which we take this future in, will decide largely what is going to happen in the world.

The jews want to protect us very much, so they create Driver-less cars now. Since genociding half the planet has them very interested in the value of human life.

For example. You have amassed data that a Goy is bad from the eavesdropping devices you have on them.

He is on his way to work as usual, and you know it because you have been snooping into his schedule about this from his brain-chip, or smartphone.

The driver-less car speeds up to 350 kph, and crashes to a wall, all of a sudden. It's covered up in the news, because driver-less cars are 100% safe, and of course, like the rapefugee crisis, nothing is bad here and there is no need to mention it. This world is not a world of bad Goyim.

You have successfully killed this goy from the comfort of your office. Happy Jew. The same night you sacrifice another Goy to celebrate the fact of "God's omnipotent power over this world", because you know, this "God" was never rabbi jesus as the Gentiles believed, but 'you'. Justice of "Jehovah" has been served.

---

### **Former GM vice chairman: 'It is absolutely inevitable — human-driven vehicles are on their way out'**

Bob Lutz, the former vice chairman of product development for General Motors, wrote a missive in "Automotive News" that society is "approaching the end of the automotive era."

Lutz predicts that human-driven cars will go the way of horses — they may be kept by the wealthy on ranches and at country clubs as forms of entertainment, but will disappear from highways.

He told CNBC on Tuesday there would be a tipping point where federal regulators officially phase out human-driven cars based on their disproportionate contribution to accidents.

Self-driving cars are coming very soon, and will replace the human-driven variety faster than most people think, according to Bob Lutz, the former vice chairman of product development for General Motors.

"It is absolutely inevitable — human-driven vehicles are on their way out," Lutz told CNBC's "Squawk on the Street" on Tuesday. "From a standpoint of moving human beings around the surface of the planet safely and efficiently, let's face it: It's the only way to go. Human beings just can't handle it anymore."

Lutz predicts that human-driven cars will go the way of horses — they may be kept by the wealthy on ranches and at country clubs as forms of entertainment, but will disappear from highways.

He told CNBC on Tuesday there would be a tipping point where federal regulators officially phase out human-driven cars based on their disproportionate contribution to accidents.

Lutz wrote a missive in "Automotive News" that society is "approaching the end of the automotive era" and that automotive retailers should "kiss the good times goodbye" as most future transportation will be "owned by the Ubers and Lyfts and God knows what other companies that will enter the transportation business in the

future."

The piece elicited strong reactions from his contacts in the industry and the feedback was "not all good," Lutz told CNBC.

It's not a new prediction from Lutz, and it certainly has roots in reality. On Tuesday, Alphabet self-driving car company Waymo said it would start a ride-hailing service with driverless cars.

Still, Lutz said, GM is one of the automakers that "gets it," based on investments like Lyft and Maven. He expects GM will make other similar investments down the road. He also said he thinks smart car makers still have a shot at avoiding becoming the Nokia of transportation.

"Cars are entertainment, they're a social object, they're psychological object, they are objects that help attract the opposite sex, or whatever sex you're trying to attract," Lutz said. "That has nothing to do with efficiently transporting human beings."
